

Isophon Cassiano

Isophon's response to God's present, Accuton

Lee, Jong Hak

The biggest problem of accuton driver units is that you can get a certain coherence in sound and speed of each driver only when you use the full accuton drivers. Above all, the main problem lies in the bass. It is not that easy to control it. However, Isophon has achieved natural harmony between midband and bass by employing 4th order filter. Therefore, Isophon could take a natural and true-to-life sound of C-90 unit which is my favorite to a new level.

Cassiano also boasts state-of-the-art enclosures. their tapered cabinets front-to-back is a measure to prevent diffraction and resonance. Enclosure material itself is also outstanding.

They combine different materials for enclosures and the combination of different materials does not affect overall sound reproduction as each resonance frequency point is different. For 3-way speakers with two woofers employed, the size is not that big. Therefore, they fit well into Korean housing environment which is one of the biggest advantages.

Jeong, Sung Woo

Isophon is one of the most successful brands in a short period. Recently, it is considered to be the best selling brands in Korea.

Then, what would be the secret of the success? I think the best advantage is a high price/performance ration. Of course, Cassiano is a high priced item but it is thought of as competitive in terms of price compared to other speakers using diamond tweeters and ceramic units. In addition to this, their sound is balanced and modern. All of these are attributed to their tuning skills accumulated through their long history. The fact that they are easy to drive is also one of the tricks to their success.

Most of all, their sound quality is outstanding. They put cutting edge design philosophy in Cassiano and still maintain musical balance and beauty. The success story of Cassiano will continue on and on.
